INTENDED USE

The C-reactive protein assay is intended for the detection of canine C-reactive protein (CRP) in dog serum. C-reactive protein is an acute-phase protein produced by the liver in conditions of inflammation, bacterial infection, or tissue trauma.

PRINCIPLE OF ASSAY

Canine sera for testing are diluted to 1:500 and allowed to react with antibodies coated on specially treated micro-wells. After appropriate incubation, the wells are washed to remove unreacted serum proteins, and an enzyme-labeled goat anti-dog CRP (conjugate) is then added to react with and tag the antigen-antibody complexes. Following another incubation period, the wells are again washed to remove unreacted conjugate. A urea peroxide substrate with TMB as chromogen is added to start color development. Development of a blue color indicates a positive reaction while negative reactions appear colorless or with a trace of blue. The reaction is interrupted with a stop solution that turns the blue positive reactions to yellow. Negative reactions remain colorless or with a hint of yellow. Color intensity (absorbance) is read at a wavelength of 450nm on a spectrophotometer or ELISA reader. Semi-quantification of absorbance can be accomplished by the use of a standard curve generated by measuring four-fold dilutions of the standard provided.

REAGENTS AND MATERIALS SUPPLIED

This kit supplies sufficient materials for 96 determinations.

1. CRP ELISA microplate
   96-well plate containing an affinity purified goat anti-dog CRP-IgG and packaged with desiccant, ready to use.

2. Conjugate (100x), 0.13 mL
   Concentrated affinity-purified horseradish peroxidase (HRP)-labeled goat anti-dog CRP-IgG with stabilizers and a preservative. Protect from light.

3. CRP Standard, 10X, 0.25 mL
   Dog serum with elevated CRP concentration. Dilute 1:10 for standard 1, then serially dilute three-fold. Contains proclin 150 ® as preservative.

4. Wash Buffer, 1 packet
   Phosphate-buffered saline (PBS) with Tween 20, pH 7.4 and 0.05% Tween 20 when reconstituted to 1L with distilled water.

5. TMB Substrate, 12 mL
   A solution containing urea peroxide and 3,3’, 5,5’-tetramethylbenzidine (TMB) supplied in a protective opaque bottle. Ready to use. Protect from light.

6. Stop Solution, 12 mL
   Diluted phosphoric acid, ready to use.
WARNING

1. DO NOT INTERCHANGE COMPONENTS BETWEEN KITS AND DIFFERENT LOTS OF THE SAME TEST.
2. The control sera have not been screened for infectious agents. Since no testing can assure the absence of infectious agents, however, these reagents, as well as the serum specimens and equipment coming in contact with these specimens, should be handled with good laboratory practices to avoid skin contact and ingestion.
3. The coated microwells are prepared with inactivated antigens. However, they should be considered potentially infectious and handled accordingly.

Storage and Handling
Kit components should be stored at 2-8°C. Bring them to room temperature (20-25°C) before opening bottles and plate pouches. Diluted conjugate remaining after use should be discarded. TMB substrate and stop solution are also stable at room temperature.

SPECIMEN COLLECTION

Qualified personnel should collect blood samples using approved venipuncture techniques. Allow sample to clot and separate serum by centrifugation. Transfer serum aseptically to a tightly closing sterile container. Store at 2-8°C. If testing is to be delayed longer than 5 days, freezing the sample at -20°C or colder is recommended. Acute specimens should be drawn at the onset of illness; convalescent specimens should be obtained 1-2 weeks later.

PROCEDURE

Materials Required But Not Supplied
1. Distilled or deionized (purified) water
2. Clean 250 or 500 mL wash bottle for wash buffer.
3. Test tubes or microtiter plate for preparing standard dilutions.
4. Precision pipette(s) (2uL to 1000uL) for making and delivering dilutions.
5. Adhesive cover for microplates.
6. ELISA reader equipped with a 450nm filter. A program for data reduction would be helpful.

Precautions
1. Do not use components past expiration date.
2. HRP-labeled conjugate and TMB-substrate are photosensitive and are packaged in a protective opaque bottle. Store in the dark and return to storage after use.

IMPORTANT: Bring kit components to room temperature (20-25°C) before opening bottles and plate pouches. Allow at least 30 minutes for this process.

ASSAY PROCEDURE

1. Prepare wash buffer by adding 1 packet of powder to 1L of distilled water.
2. Prepare the standards as follows:
   - Standard 1 = 40.0 ug/mL: 1:10 dilution of standard provided.
   - Standard 2 = 13.3ug/mL: dilute Standard 1 three-fold, e.g. 1 unit of standard 1 plus 2 units of wash buffer.
   - Standards 3 (4.4ug/mL) and standard 4 (1.5ug/mL) are prepared by serial three-fold dilutions following standard 2.

   Please consider the following dilution scheme as a guide

<table>
<thead>
<tr>
<th>Standard #</th>
<th>Concentration</th>
<th>Volume Transferred</th>
<th>Diluent Volume</th>
<th>Total Volume</th>
<th>Final Volume</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>40.0 ug/mL</td>
<td>18 µL</td>
<td>162 µL</td>
<td>180 µL</td>
<td>120 µL</td>
</tr>
<tr>
<td>2</td>
<td>13.3 ug/mL</td>
<td>60 µL</td>
<td>120 µL</td>
<td>180 µL</td>
<td>120 µL</td>
</tr>
<tr>
<td>3</td>

<td>1.5 ug/mL</td>
<td>60 µL</td>
<td>120 µL</td>
<td>180 µL</td>
<td>180 µL</td>
</tr>
</tbody>
</table>
3. Dilute each serum sample 1:500 as follows: into a dilution vial, add 1mL of wash buffer. To this, add 2uL of serum.
4. Add 100ul to each well and incubate at ambient temperature for 30 minutes. Record the location for later reference.
5. Wash plates 3 - 4 times with a multi-channel micropipet or a plate washer. Use approximately 300ul per microwell. Tap plates on a stack of absorbent paper towels to remove residual buffer.
6. Dilute stock conjugate (100x) to the desired working dilution (1x) with the PBS-T buffer.
7. To each microwell, add 100ul of conjugate.
8. Cover plate and incubate for 30 minutes at ambient temperature (20-25°C).
9. Wash plate as in step 5.
10. To each microwell, add 100uL TMB/substrate solution and allow reaction to proceed at ambient temperature for 10 minutes. A blue color indicates a positive reaction.
11. Stop reaction by adding 100uL of Stop solution to each well. Reaction mixture turns from blue to yellow.
12. Read absorbance (OD) on a microplate reader equipped with a 450nm filter. Construct standard curve and read off values for patient samples. Multiply values by 5 to get actual serum concentration.

QUALITY CONTROL

Routinely run at least two controls each giving values at the top or bottom regions of the standard curve respectively. An occasional prozone may be encountered in sera with high CRP values. In this situation, due to antigen excess, all the CRP available may not have reacted with the conjugate. Therefore, test at higher dilution, e.g. 1:1,000 or 1:2,000 to obtain more accurate results.

REPORTING OF RESULTS

Reference range: 3 – 25ug/mL
Abnormal: over 25ug/mL

QUALITY ASSURANCE

This assay is compliant with the Quality Assurance policies and protocols implemented at IBL-America, Inc.

LIMITATIONS

Lipemic sera may interfere with specific antibody reaction.
PERFORMANCE CHARACTERISTICS

SENSITIVITY

The IBL-America canine CRP assay is designed to detect elevated levels of CRP. The following data was produced to generate data on the sensitivity of the assay and maybe useful in research applications where sensitivity parameters need to be defined.
